
CHAPTER 211 INTRODUCTION TO MISCELLANEOUS TASKS

1. MISCELLANEOUS TASKS. FAA Aviation Safety Inspectors (ASI's) are often required to perform activities outside of the normal realm of pilot and air operator certification and inspection. These activities either support internal functions or render assistance that was requested as a result of the FAA's role as the government's main source of expertise on aviation safety in operations.

3. CONTENT. These chapters provide general guidance to ASI's for those occasions when their expertise is called upon.

5. GENERAL. The areas covered include serving on Flight Standardization Boards (FSB's) and flight operations evaluation boards (FOEB's), evaluation of aircraft operations from airports and air traffic control (ATC) facilities, providing technical assistance, and inspection of an airport.

7. SPECIFIC GUIDANCE. The information that follows is an overview. Specific procedures may be provided by the FAA component that is being supported. Other activities may rely on the experience of the ASI and the ASI's supervisor. If an unusual situation arises, the ASI's manager should be consulted to determine the appropriate course of action.
